BOOK SYNOPSIS

This specialist new economics book investigates how foreign direct investment inflow exerts influences on Chinas income inequality levels. It outlines the empirical affects of FDI using dynamic panel data mining techniques, which the author has extrapolated from a large amount of government-level source data. Income inequality is starting to exert real pressure on Chinas economy and politics. This book aims to build a bridge between FDI and Chinas income distribution issues. It sets out a general equilibrium macroeconomic model for China, then empirically tests the theoretical conclusions of this model using firm-level panel data. The covering includes; an explanation of how the author has researched the FDI-inequality nexus: a succinct survey of the available research findings on this subject, plus the authors clarification of the key elements at play: a carefully set out general equilibrium model based on endogenous growth theory for an open economy including macro, middle and micro perspectives on the FDI-income inequality nexus: an outline of the dynamic panel data method used in this key book: estimated statistical models for the impacts of FDI on wages and employment levels in China.
